Treth Cleaning

Teeth's cleaning is a process in which plaque (a thin soft white layer covering the teeth) or calculus (the hardened or calcified plaque) is removed using the latest dental ultrasonic machine at high speed with water spray as a coolant. Plaque usually needs one session of cleaning after which airflow technique and professional polithing is performed. As for calculus it may require 1 to 2 sessions depending on its extent. If its superficial then one session is required after which polishing is done to smooth the teeth. If the calculus is deep then that requires 2 or more sessions of deep scaling in which the roots are also cleaned, smoothed and polished. If any further treatment is unexpectedly added to the treatment plan for any reason, it would be subject to additional cost which the patient has to pay, and would require extra treatment them derra resalons. After scaling the patient may feel slight to moderate sensibility depending on extend of the calculus. Some mobility may be experienced in cases of deep scaling the severity of which depends on extend of bone loss and may require further treatment. Some patients may notice some spaces between their teeth those are due to the removal of the calculus was occupying that space.
