Patient by name Neesha. Dilip. Gursahani Age: 50 years came to the clinic with the chief complain of fractured filling in the left lower back tooth region since 2 days. On oral Examination it was found the patient has a fractured restoration with tooth #18 (mesiobuccal). On radiographic examination, it was found the tooth was root canal treated. On clinical evaluation it was found tooth #18 does not have enough crown structure to support and hold the restoration, therefore post and Core was advised with tooth #18. Any rebuild stone with composite resin will not last long and if the patient does not maintain well, the restoration or the tooth may fracture as there is no pillar (post) to support the restoration. If the tooth fractures, then extraction will be needed. But the patient does not want post and core and only wants filling for now. She said she will go for post & Core, crown lengthening and a crown with tooth #18 after few months either at her home country or in Dubai.
